Codimension during stable search with full propagation

Natural ordering; both searches exhaust with no legal action. Bar labels show exact counts.

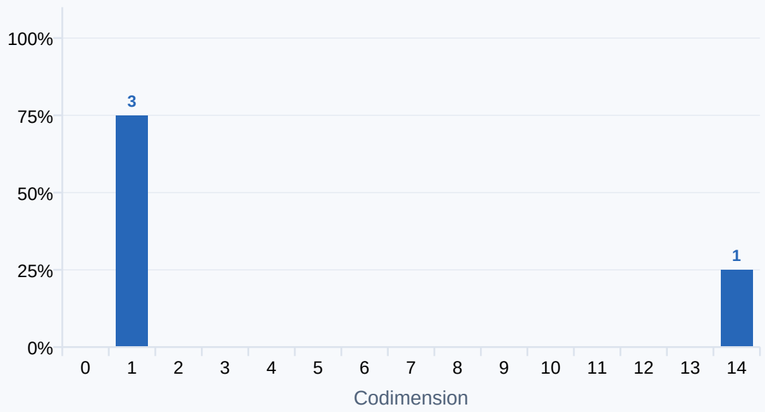
Problem codimension in universe

Relative codimension: selected HC

Relative codimension: secondary HCs

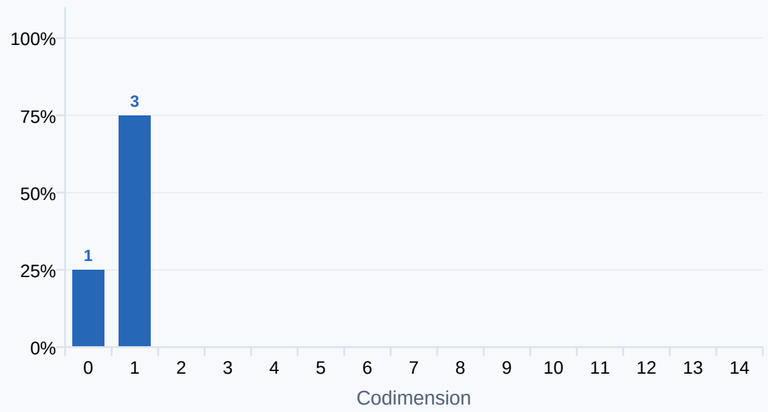
Match 123 | 4 discovered problems

Share of discovered problems (one observation per problem)

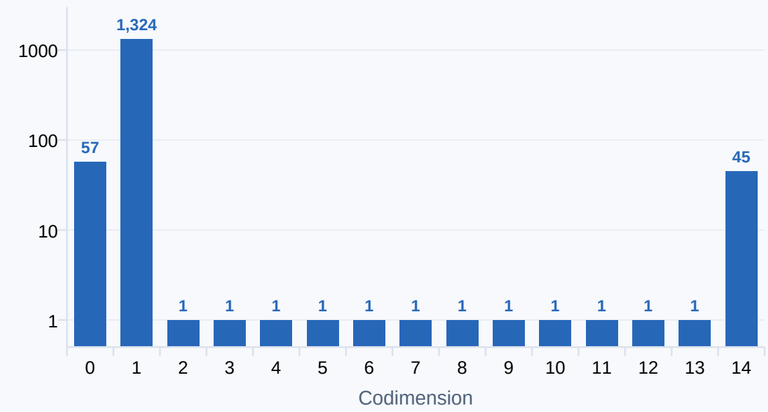


Fixed-axis count equals effective universe codimension in both runs.

Share of discovered problems (one observation per problem)



1,438 intersecting secondary pairs; count axis is logarithmic

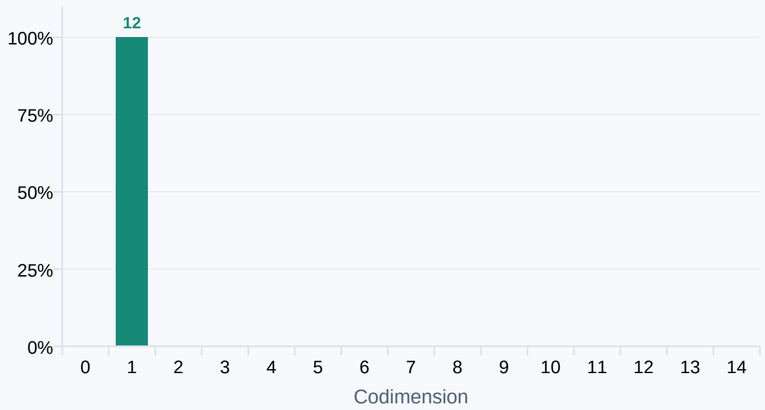


Disjoint secondary pairs excluded: 663

Bins 2 through 13 each contain exactly one pair.

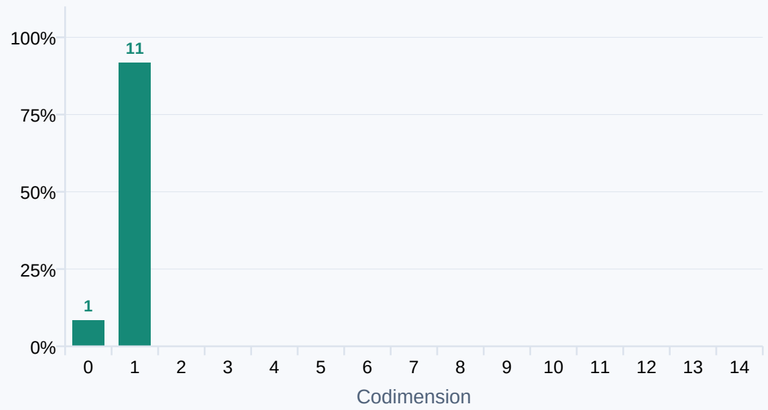
100timelines | 12 discovered problems

Share of discovered problems (one observation per problem)

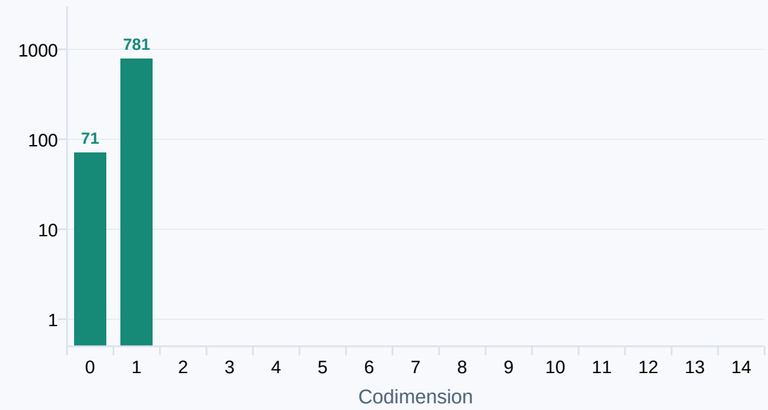


Fixed-axis count equals effective universe codimension in both runs.

Share of discovered problems (one observation per problem)



852 intersecting secondary pairs; count axis is logarithmic



Disjoint secondary pairs excluded: 0

Relative codimension counts axes partially cut in that HC, exactly as HC::is_slice_good() does.

These histograms describe the full-removal trajectory: 4 and 12 problems, not independent samples of all possible conflicts.
